**Load libraries**

**Write functions to shift column data to the left**

## **Round 1 Results**

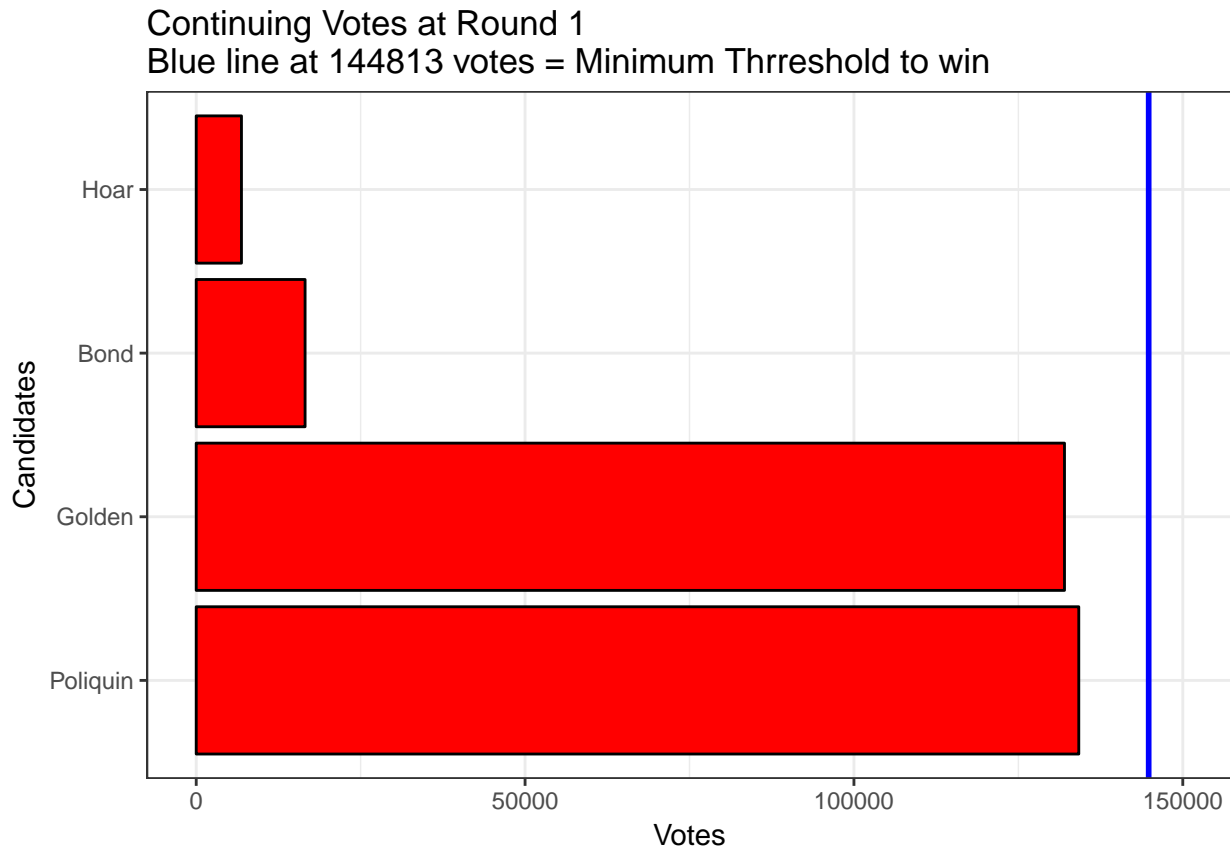

```
##
##      Bond      Golden      Hoar Poliquin
##    16552    132013    6875   134184
##
##      Bond      Golden      Hoar Poliquin
##    0.0571    0.4558    0.0237   0.4633
```

**The vote totals are identical to those in the updated certified report.**

**Poliquin with 134184 votes, led in Round 1 with 46.3%. According to the rules of ranked-choice voting, to be declared a winner, a candidate had to have at least as many votes as the winning threshold.**

```
## The winning threshold was 144813 continuing votes
```

```
## Poliquin fell short of winning by 10629 votes
```

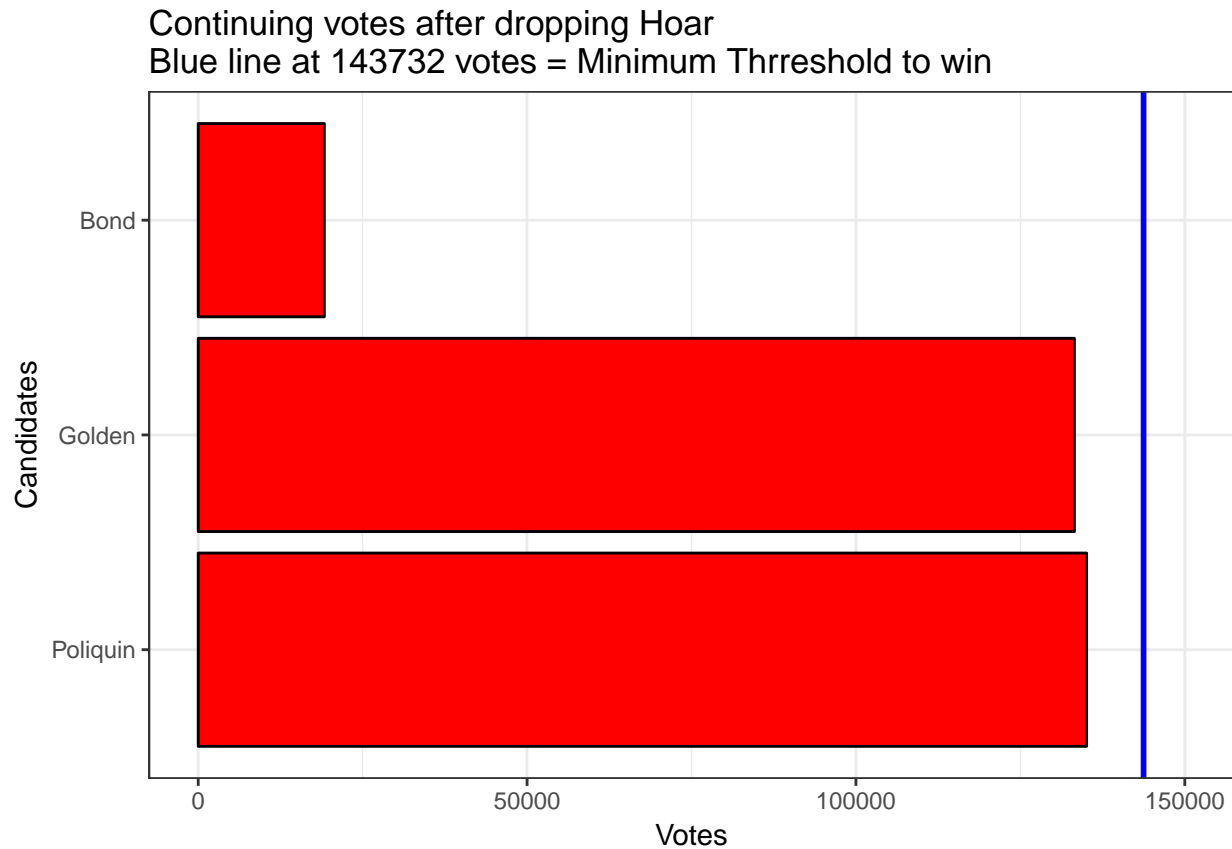

We now proceed to the next round by dropping the candidate with the fewest votes: Hoar.

### Results after dropping Hoar

```
##
##      Bond      Golden Poliquin
##    19173    133216    135073
##
##      Bond      Golden Poliquin
##    0.0667    0.4634    0.4699
```

All three remaining candidates gained votes from the alternative choices of the Hoar voters. Now Poliquin led with 47.0 to 46.3 for Golden, but the tally was still less than 50% +1.

```
## The winning threshold was 143732 continuing votes
## Poliquin fell short of winning by 8659 votes
```

So we now remove Bond votes and continue the analysis.

```
##
##   Golden Poliquin
## 142440  138931
##
##   Golden Poliquin
## 0.5062  0.4938
```

## Final Results

The ranked-choice process has produced a clear winner. Golden now has 142440 (50.62%) of the continuing votes, compared to 138931 (49.38%) for Poliquin.

```
## The winning threshold was 140686 continuing votes
## Golden exceeded the minimum threshold by 1754 votes
```

Vote tally at Final Round  
Blue line at 140686 votes = Minimum Threshold.  
The winner, Jared Golden got 1754 more votes than needed.

Some have questioned the validity of the election results, because the software used by the Secretary of State was “proprietary”. In other words, we don’t know what it is and what algorithms it used. Thus it was important to demonstrate that “open” software, available to all, can get the identical results, and give voters confidence that the process is fair, accurate and transparent.

The gold standard for data analysis in science, elections, etc. is “Reproducibility”. This analysis was done with the programming language “R”, using Rmarkdown to produce this pdf file. It could also be output to Word and html formats.

Here are the same results obtained by the “Python” programming language.
